Nylon 66 + Carbon Black in the material to improve UV / External Weathering

Polyamide Nylon (PA, PA6.6, 66) is the standard polymer used in the Hobson range of plastic or nylon fasteners. It is recognised worldwide for being the most suitable material for fasteners as it has:

- Excellent filling qualities and is easily moulded into long shapes such as threaded rod
- Good toughness, tensile strength and resistance to creep, particularly in high temperatures
- Superior wear properties, low coefficient of friction and exceptional chemical resistance to aromatic hydrocarbons, greases and oils

Nylon is a hygroscopic material which has a tendency to absorb moisture from the surrounding environment. The amount of absorption will depend on the environmental conditions. When water or moisture is absorbed by Nylon, it behaves like a plasticizer in plastics reducing the tensile strength, stiffness; and increasing elongation, impact strength and energy absorbing characteristics.

Outdoor weathering can be improved by the addition of carbon black in the material and will perform well in long range service in most applications.

- Protects surfaces and offers good electrical insulation
- Absorbs shocks and vibration
